

ELSCO Transformers — Agent Readiness Actions for Manufacturers: Deploy Guide

Plain-English instructions for your web team. Every file is drop-in — **no backend changes**. These files make your site readable and actionable by AI agents so an agent can correctly represent your product in a comparison and compose a valid quote request.

Where each file goes

File	Where it deploys	What it does
<code>capability-manifest.jsonld</code>	Site-wide — paste in <code><head></code> of /about (or homepage) as a <code><script type="application/ld+json"></code> block	The envelope you can quote/build
<code>product-<slug>.jsonld</code>	In <code><head></code> of the matching product/spec page	Machine-readable product record + the RFQ action
<code>.well-known/quote-request.schema.json</code>	Host at https://elscotransformers.com/.well-known/quote-request.schema.json	The inputs-to-quote contract an agent reads
<code>.well-known/api-catalog</code>	Host at https://elscotransformers.com/.well-known/api-catalog (RFC 9727, no extension)	Discovery pointer to the contract + capability
<code>.well-known/agent-quote.json</code>	Host at https://elscotransformers.com/.well-known/agent-quote.json	Describes the (proposed) agent RFQ endpoint; human form stays the fallback
<code>reviews.jsonld</code>	Testimonials page or product page <code><head></code>	Structured testimonials (add star ratings only once you collect them)
<code>llms.txt</code>	Host at https://elscotransformers.com/llms.txt	Canonical-content locator for AI crawlers

Before you publish — fill the top-up fields

Any value marked `PENDING_CLIENT_CONFIRMATION` (or an empty `disambiguatingDescription`) needs a real value from your team before go-live. These are the ~30%% we could not read from your existing site.

Notes

- The agent RFQ *endpoint* is **proposed**, not live. The contract and your human form are both real; the human form stays the fallback until you wire the endpoint.
- Do not add star ratings to `reviews.jsonld` until you actually collect them (no fabricated ratings).
- Validate the JSON-LD with Google's Rich Results Test and schema.org validator after deploy.
